## New Geostationary Satellite Systems

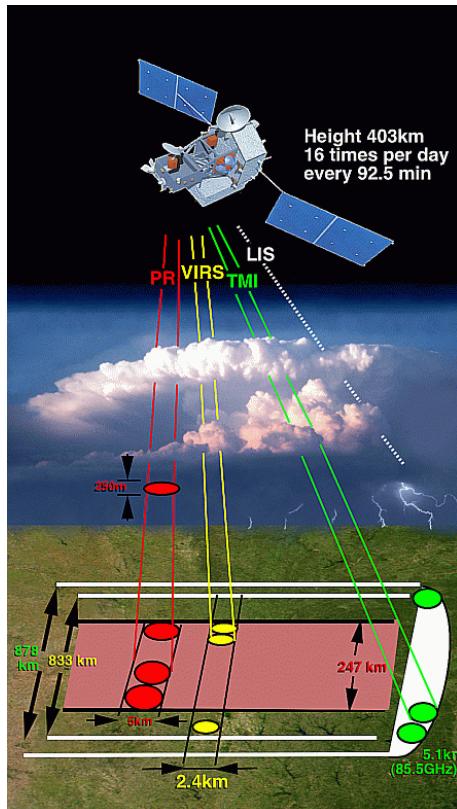

Meteosat Third Generation  
> 2018

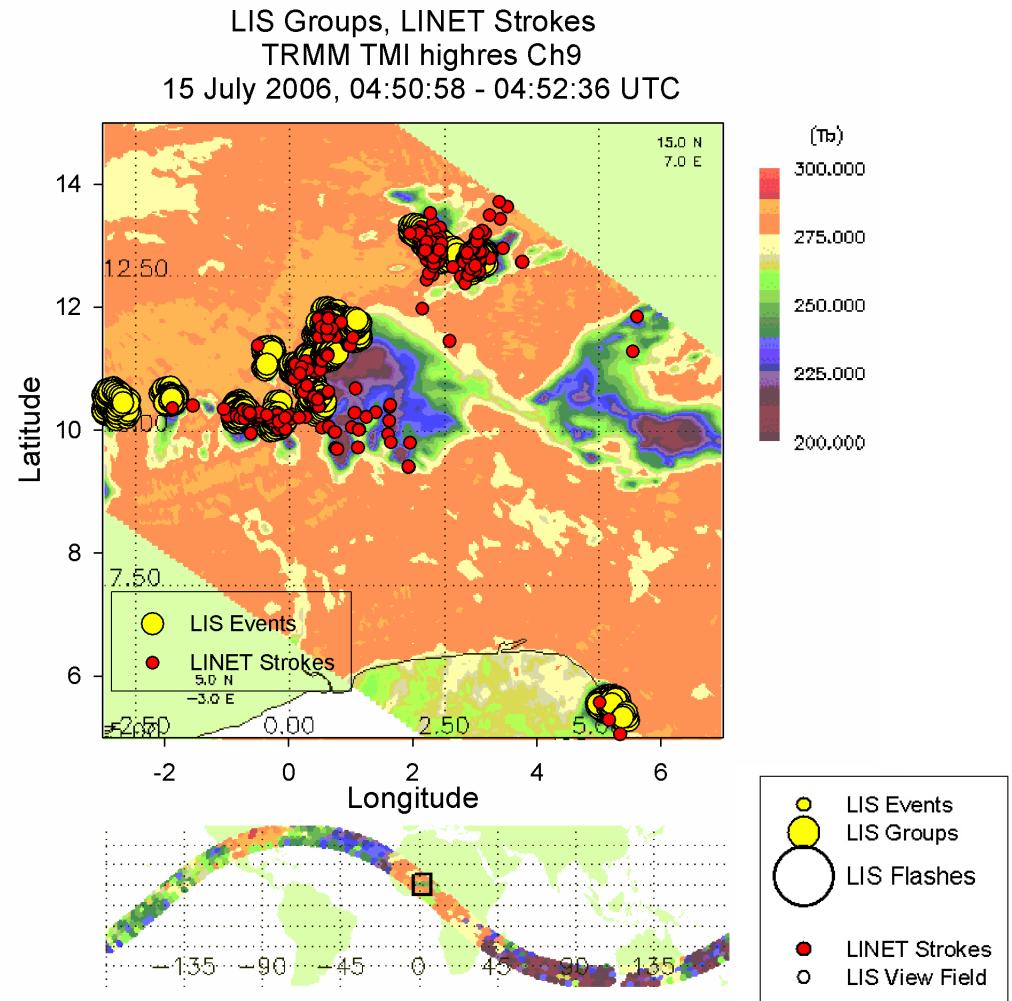

Geostationary Operational  
Environmental Satellite-R  
Series (GOES-R)  
> 2015

# TRMM (Tropical Rainfall Measuring Mission)

## TRMM Instruments

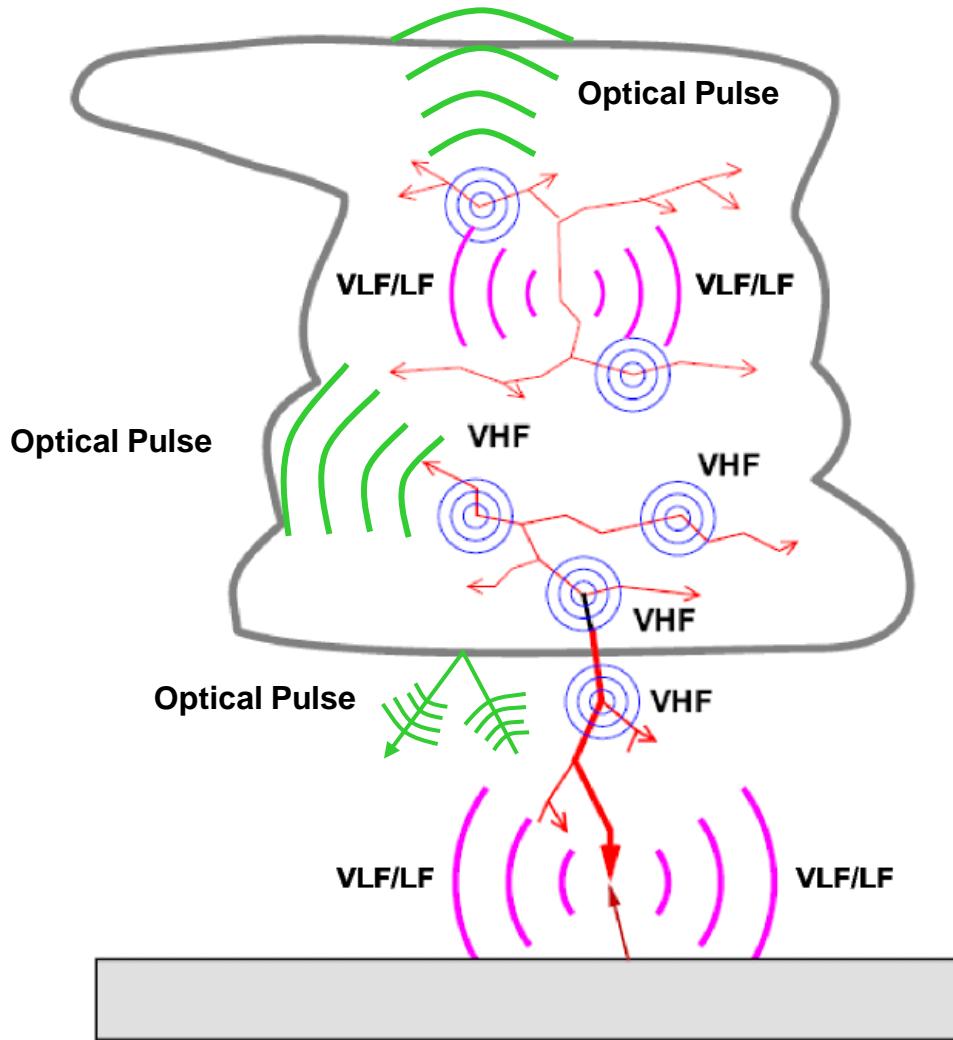

- ▶ Visible and InfraRed Scanner (VIRS)
- ▶ TRMM Microwave Imager (TMI)
- ▶ Precipitation Radar (PR)
- ▶ Lightning Imaging Sensor (LIS)

# Flash Types and Emissions

## CG, IC and VLF/LF, VHF, Light

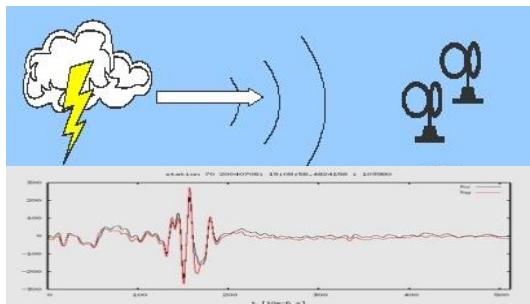

Intra-cloud (IC) and cloud-to-ground flashes emit VLF/LF, VHF and optical radiation

Long wavelength VLF/LF signals have one or several source points per flash arising from long channel segments

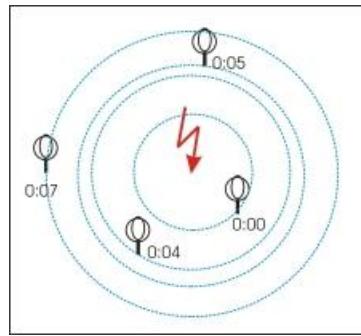

Short wavelength VHF signal have many source points per flash and allow for reconstructing short scale channel details

# LINET (Lightning Detection Network) System Characteristics

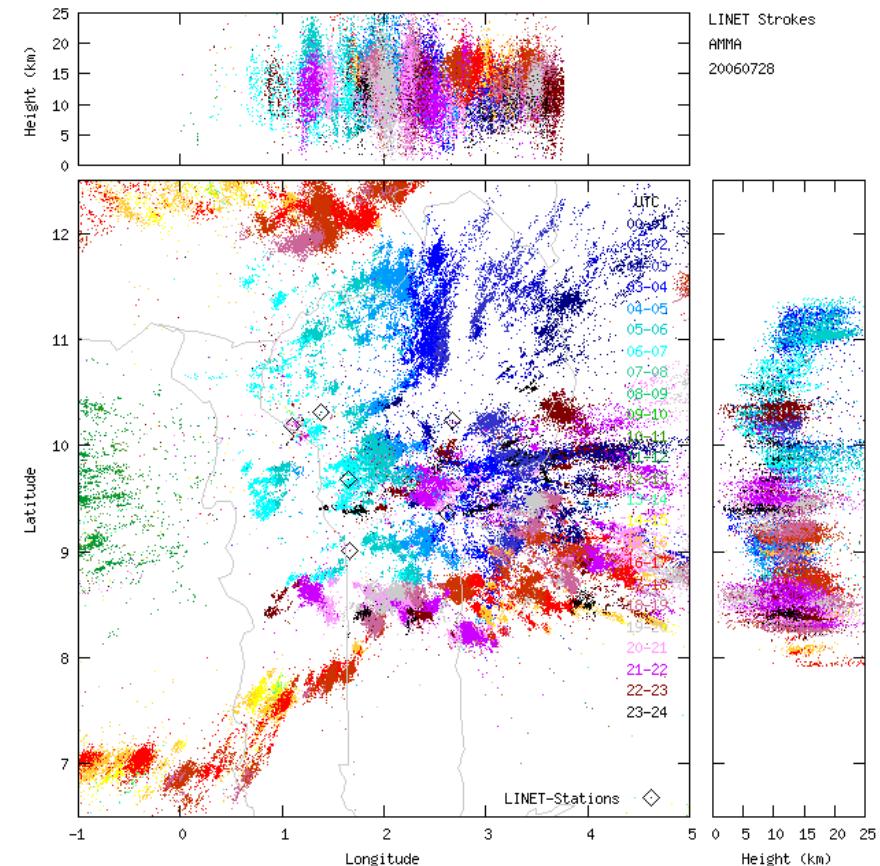

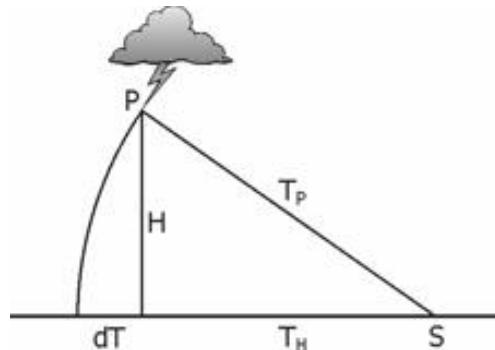

- Measurement of magnetic field

- TOA Method for lightning location

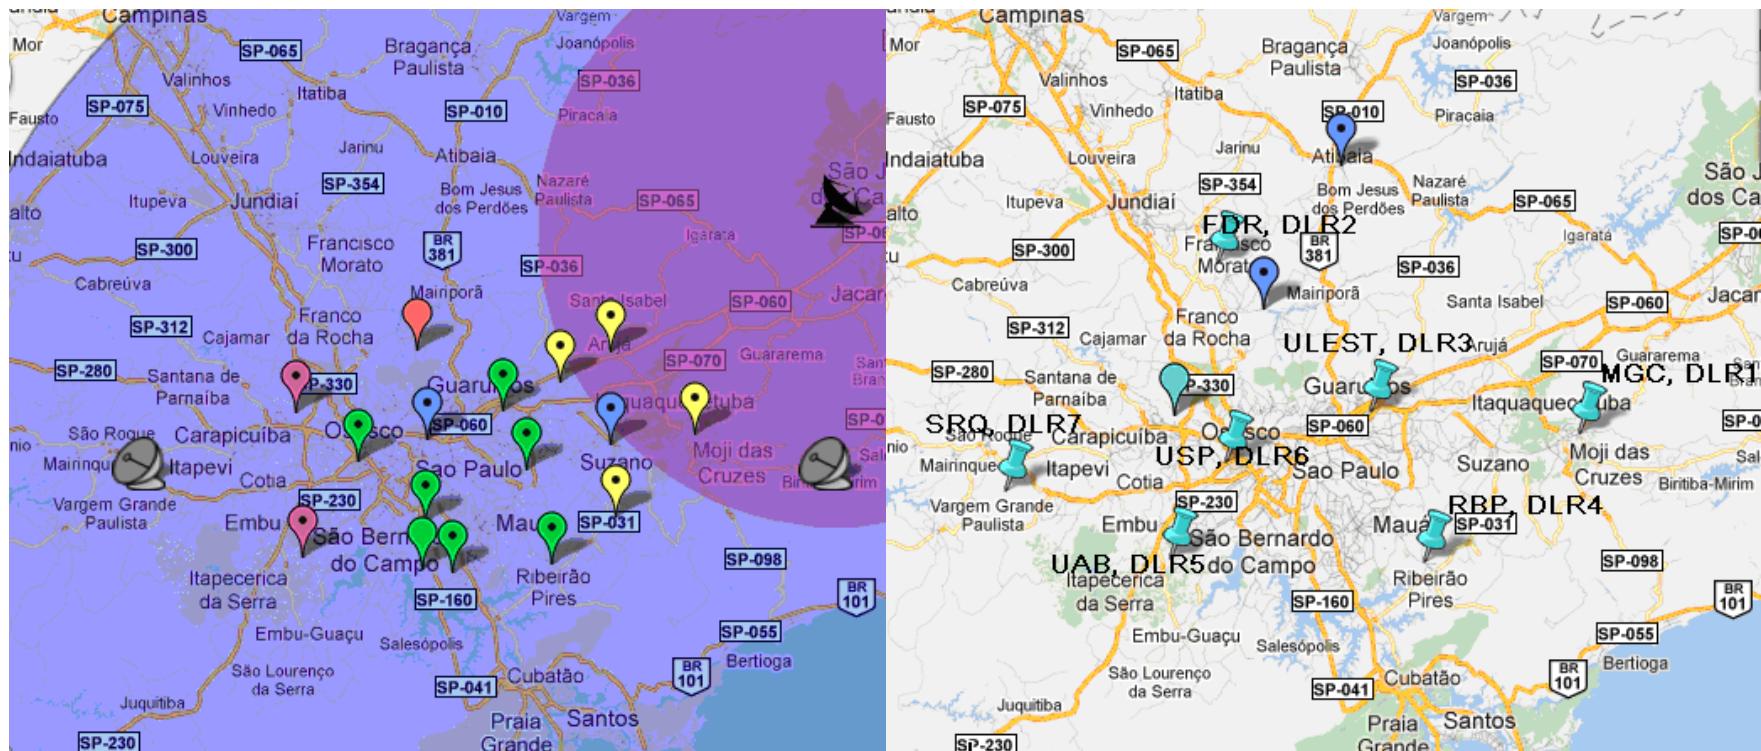

- IC - CG discrimination
- Height of IC events

# LMA and LINET Sites

## XPOL and operational radars

# LMA and LINET

## LMA and LINET configuration, XPOL and operational radars

# LINET Sites

## CHUVA, Sao Paulo

Time differences of closest signals

LMA followed by LINET and LIS  
LINET and LIS correspond well

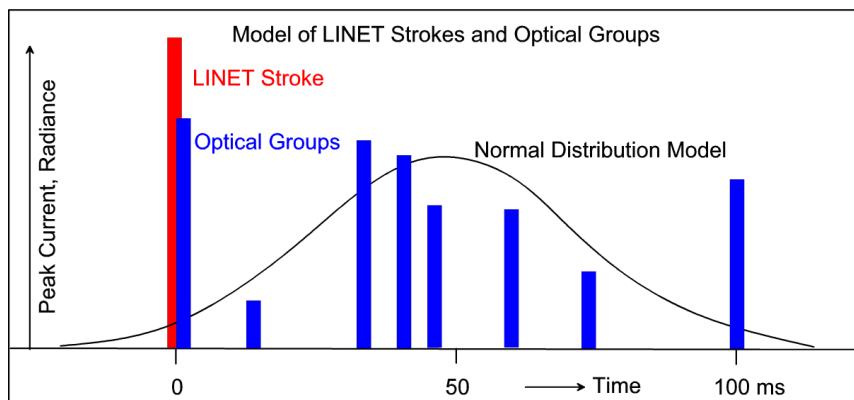

# Modeling of MTG-LI Optical Signals

## Model Strategy

Transformation of LINET RF stroke data into optical groups by a 2-step process:

- ▶ Model of cloud top optical emission
  - Number of optical flashes equals number of LINET flashes
  - One direct coincident optical group per LINET stroke
  - Distribution of additional optical groups per LINET flash according to a log-normal model for radiance, footprint and time
- ▶ Projection of group areas to optical plane of LI pixel matrix

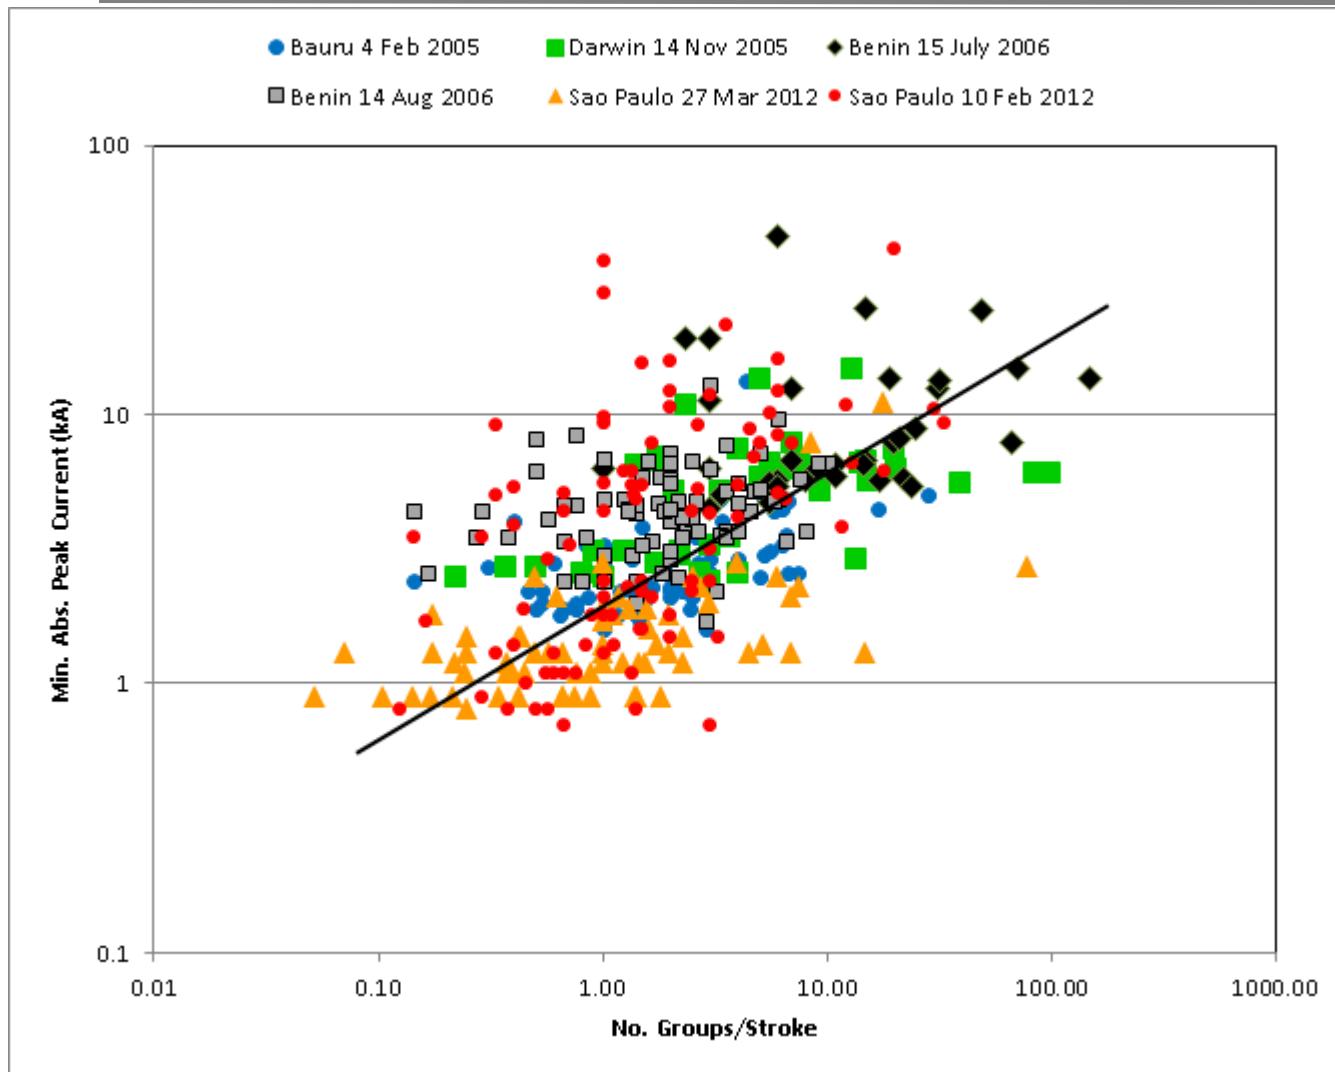

Generation of optical events from RF stroke data

# LIS Groups per LINET Stroke

## Relation to Network Sensitivity

LIS groups per  
LINET stroke  
(GPS) from  
coincident flash  
observations for  
LIS overpasses in  
different areas

CHUVA data add  
additional  
information in the  
low peak current  
regime

# Summary and Conclusions (1)

---

- ▶ CHUVA lightning campaign was very successful with respect to the objectives
  - 7 months (Oct 2011 – April 2012) of lightning data available for analysis complemented by XPOL radar data
  - 4-6 good cases with LIS overpasses of the inner network area (more than 20 cases in a wider area)
- ▶ As found in previous study, LINET strokes and LIS groups are often coincident
- ▶ LINET strokes map the flash branches similar to LMA (but with considerably less data points)
- ▶ An initial breakdown phase of vertically propagating sources can be often found in LINET and LMA data

# Summary and Conclusions (2)

---

- ▶ Higher level LINET and LMA signals have higher probability to be optically detected
- ▶ Lower level LINET and LMA signals are optically detected from above in case of missing high level precipitation (e.g. from radar)
- ▶ XPOL radar helps in interpretation of 3D cloud structure important for scattering of light
- ▶ Improvement of proxy data generation
  - a small baseline (~30 km) LINET configuration provided a high DE network thus closing the gap in coverage at weak LINET strokes (flashes)
  - The number of LIS groups per LINET stroke should not be considered as constant but rather as dependent on minimum peak current
