Chuva Workshop May 2013

# \* Background and Scope

- \* GLM needs “all kinds of LLS data” for:
  - \* Proxy product generation
  - \* Post-launch validation
- \* For each candidate dataset we need to:
  - \* Quantify its relationship to LIS Events/Groups
  - \* Quantify the relative data quality related to LIS and the other datasets
- \* This Presentation:
  - \* Description / Demonstration of a LIS:LLS Space:Time exploration tool
  - \* Description / Demonstration of LLS inter-comparison tool

# \* Monte's Movies

(no..., not Monty  
Python...)

# \* LIS Group Analysis Tool

## Example: LIS, SPLMA, and TLS-CG

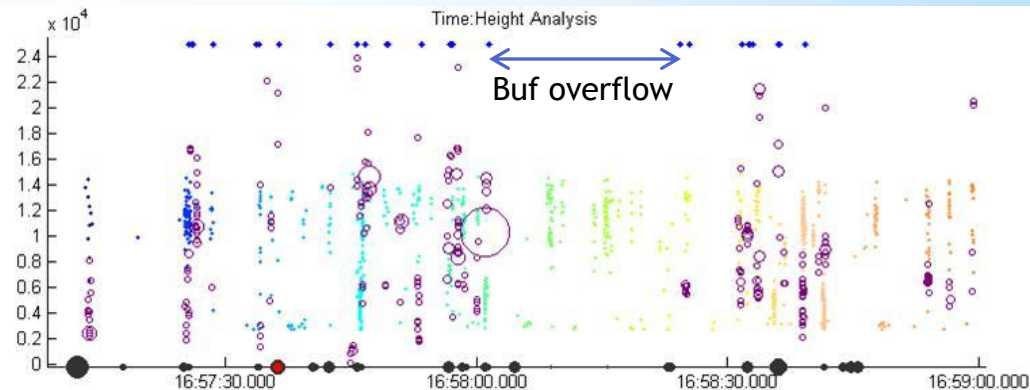

### \* Spatial Analysis

- \* Limited to LIS swath coverage for each second
- \* LIS Groups: Magenta circles w/ area = LIS group area
- \* LMA: sources color-coded by time
- \* TLS-CG: red “dots”

### \* Time:Height Analysis

- \* LIS Groups:
  - \* area  $\propto$  to radiance
  - \* “Height”  $\propto$  distance from 7 closest LMA sources
- \* LMA: same “time” color scale as spatial analysis
- \* TLS-CG
  - \* Area  $\propto$  peak current
  - \* Black: negative
  - \* Red: positive

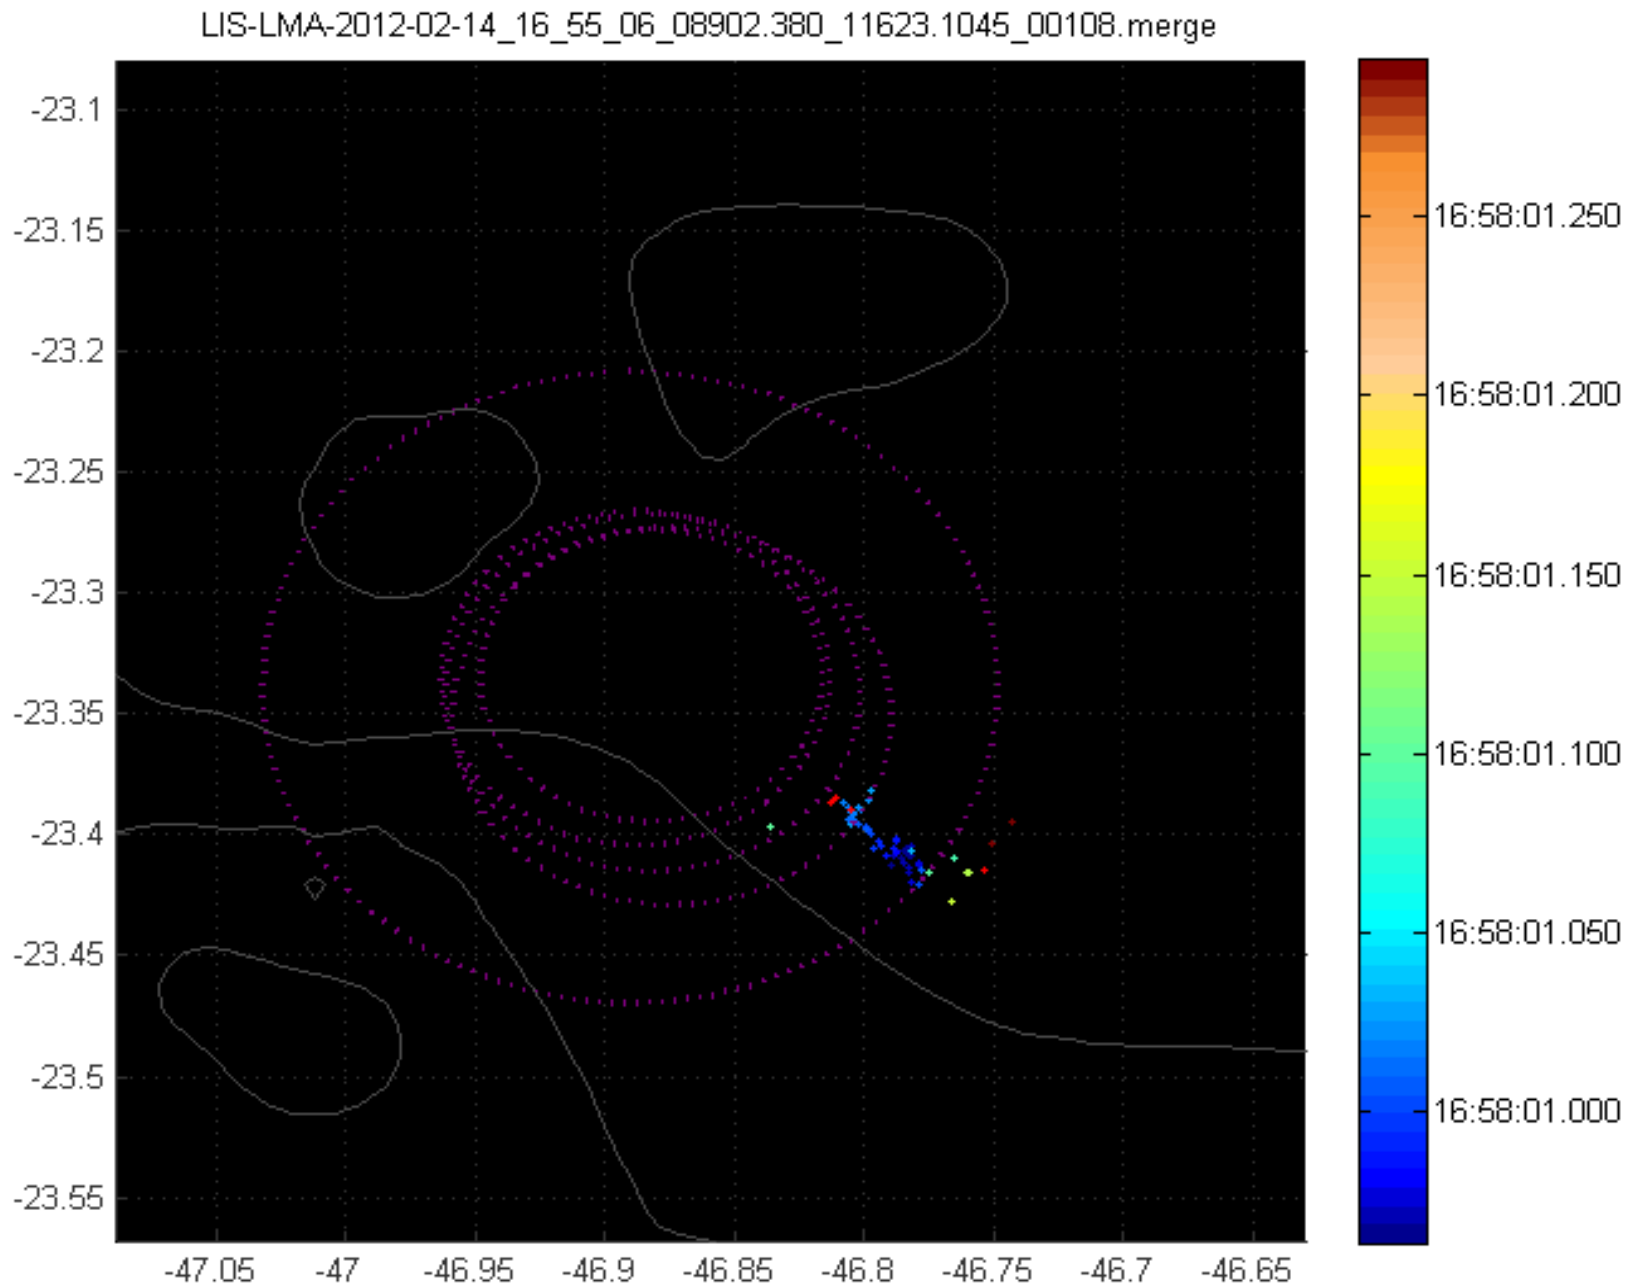

# \* Spatial Analysis

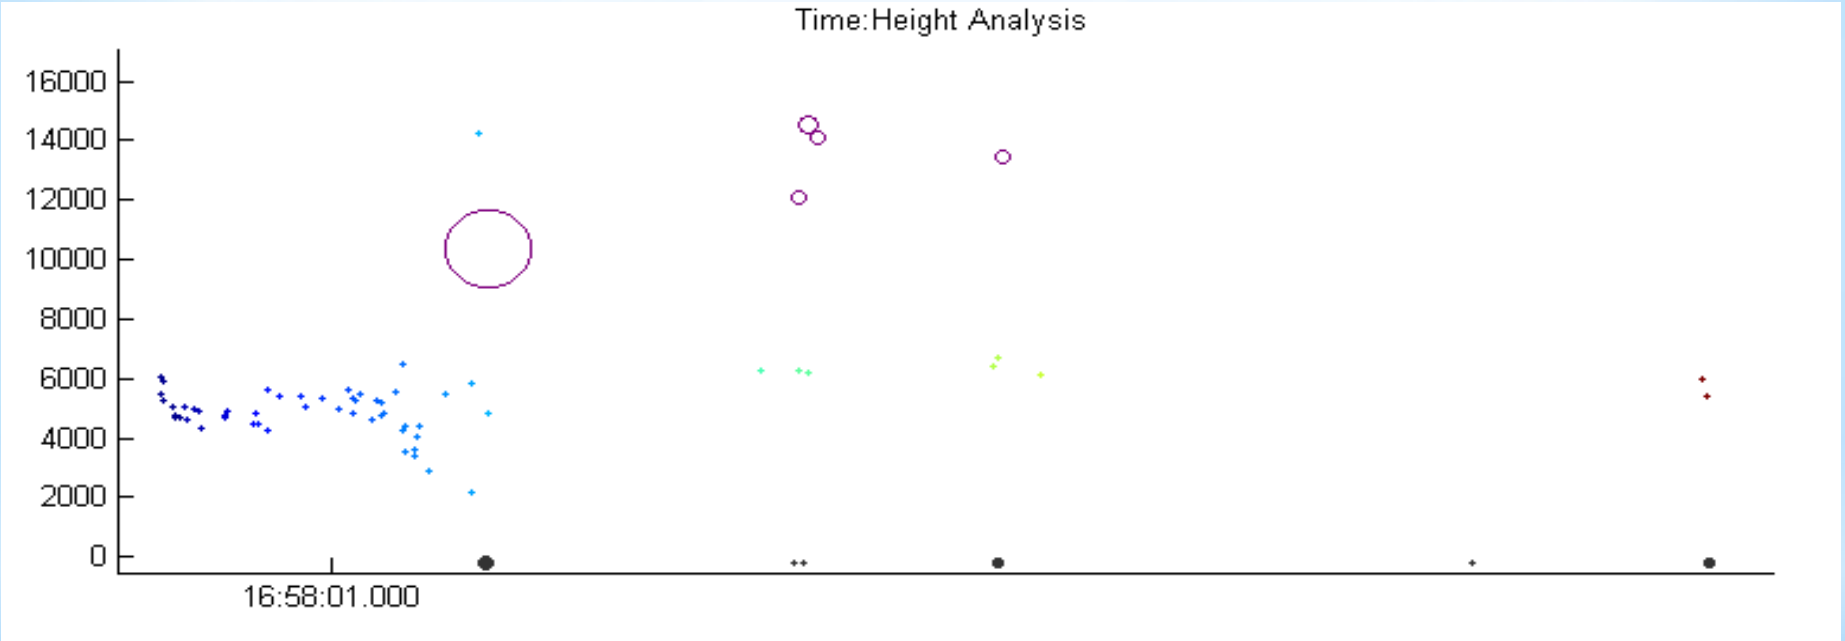

# \*Temporal Analysis

# \* Spatial Analysis - single flash

# \*Temporal Analysis - single flash

# \* LLS Inter-comparison Tool

- \* Coded in Matlab
- \* Stand-alone executables can run on Unix, Linux, and Windows
- \* Can specify datasets and related parameters in a “cfg” file using a text editor...

```
# sample Spec file for LLS comparison
# written by Ken Cummins, July 2011

# Definition of possible fields in each data file
#   Date (D): date yyyy-mm-dd
#   Time (O): Occurrence time (hh:mm:ss.mmmmmmm)
#   Lat (L): decimal degrees
#   Lon (G): decimal degrees
#   Ip (I): Peak Current (kA)
#   LocErr (E): position error (km)
#   ChiSq (C): Chi-square or consistency parameter
#   NSR (N): integer number of sensors reports
#   Type (T): G or C
#   Skip (S): field to skip
#

Ref_file: data/sampleRef.asc
Ref_fmt: DOLGIECTN

Test_file: data/sampleTest.asc
Ref_fmt: DOLGIECTN

# DT is the nominal correlation time in microseconds
DT: 100.

# DD is the nominal spatial correlation distance in km
# (should be at least DT*c = DT(sec) * 3*10^8(m/sec) =
DT(uS)*0.3(km/uS)
DD: 30.0

# MATCH is a true/false requirement for type-matching
MATCH: false

# START is the start data/time
# If not defined, starts at the beginnig of the later-start file
START: 2011-07-01@00:00:00

# STOP is the stop date/time
# If not defined, stops at the end of the earlier-stop file
STOP: 2011-07-30@23:59:59

# LATLON is the lat-lon rectangular boundry for analysis region
# in decimal degrees ( LL_lat LL_lon UR_lat UR_lon )
# If not defined, the whole region is used
LATLON: 36.,137.,41.,142.
```

# \* Tool “Outputs”

## \* Analysis “Sheets”

### \* Sheet 1:

- \* Requires date, time, lat, lon, and (optionally) type (CG/CLD pulse)

### \* Sheet 2:

- \* Requires peak current estimates

### \* Sheet 3:

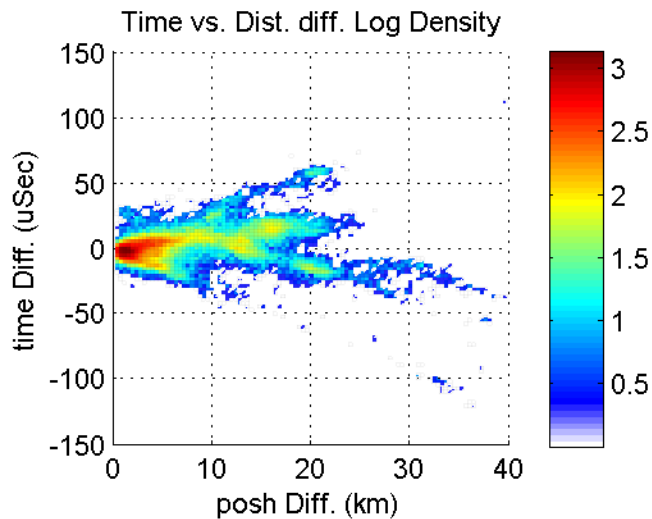

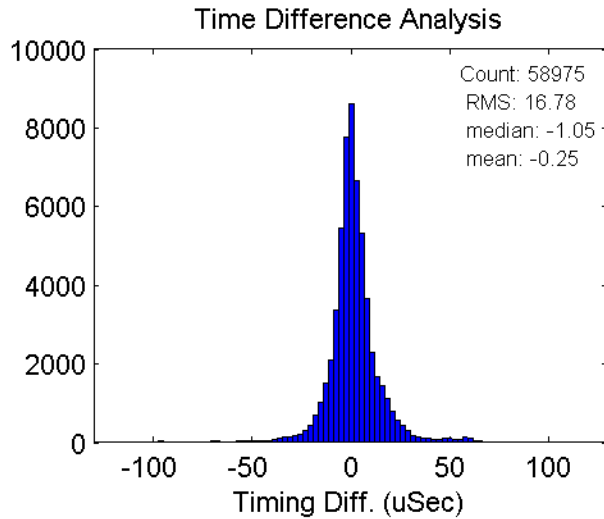

- \* Requires quality-related parameters
  - \* location error estimate
  - \* # sensors reporting the stroke/pulse

## \* Spatial Detection Efficiency

## \* Flash Analysis

# Sheet 1 - CHUVA TLS-CG vs. GLD360

GLD\_TLS-LF.cfg 16-Mar-2013 20:34:00

# \* Flash Summary Statistics

## \* METHOD:

- \* Produced flashes from LIS Groups (30 km / 0.5 seconds clustering)
- \* Determined mean groups/flash and strokes/flash
- \* Identified LIS flashes with time-correlated LLS data
  - \* GLD360 “events” (CG strokes and cloud pulses)
  - \* TLS CG strokes
  - \* TLS CG strokes and cloud pulses (not in CHUVA dataset)

LLS Network	# of LIS Flashes	Relative Group DE	Relative Flash DE	Mean Groups/fl.	Mean str./fl.
GLD360	1289	3.4	14.7	7.96	1.94
TLS-CG	433	4.1	20.1	7.05	2.85
TLS-LF “all”	446	5.8	49.8	7.78	2.78

# \* Summary / Comments

- \* LLS Correlation with LIS data must be done carefully
  - \* Must track the LIS “Swath” every second
  - \* Watch out for LIS buffer overruns
  - \* There may be small parallax issues with LIS data
  - \* LIS radiance may be a complicated function of peak current, channel geometry and path
- \* LLS Relative Performance vs. LIS Total Lightning
  - \*  $GLD < TLS\ CG < TLS(LF)\ CG+CLD < TLS\ VHF$  (studied elsewhere)
  - \* CG+ CLD data produced by the TLS LF “Short baseline” (~100 km) network was able to report ~ 50% of the LIS flashes
  - \* GLD might be sufficiently good to allow statistical up-scaling of the data for mid-oceanic LIS proxy data

# \* Future Directions

- \* Analyze/compare other CHUVA LLS datasets
  - \* Relative to each other
  - \* Relative to LIS groups/flashes
- \* Try to use above results to allow statistical up-scaling of LLS data for proxy product generation and pre-calibration of post-launch validation systems
- \* Formalize correlation between LLS estimated peak current (CG and CLD pulses) and LIS group radiance and group area
